1	Requirements.....	3
2	API endpoint.....	4
2.1	Sending the request.....	4

1 Requirements

The connecting portal client has requested a signed certificate from the portal server and the signed certificate is available locally

2 API endpoint

The API for certificate revocation will be available under the following URL path:

`/api/certificate/revoke`

The portal client must supply its certificate to the portal server when establishing a connection. If the portal client doesn't send its certificate to the portal server or the certificate is invalid (revoked, not signed by the ISPf Root CA), the portal server will respond with the HTTP status code 403 "Forbidden".

2.1 Sending the request

The portal client must make a HTTP POST request to the API endpoint. The portal server will respond with the HTTP statuscode 200 „OK“. Afterwards, the portal client must close the connection and delete its locally stored certificate. The portal server will reload its revocation list - further connections from the portal client will be denied with HTTP status code 401 „Unauthorized“.
